Abstracts

String pot displacement sensor is a device used to accurately measure linear displacement. It converts physical displacement into electrical signal output to achieve real-time monitoring of the position or movement distance of an object. When an external force pulls the wire, the wire drives the shaft to rotate, and the encoder or potentiometer calculates the corresponding linear displacement based on the rotation angle of the shaft. It is widely used in industrial automation, robotics, aerospace and test equipment.

The global String Pot Displacement Sensor market size was estimated at USD 3548.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
