Abstracts

The string-type liquid-cooled energy storage system is an efficient energy storage solution that uses liquid cooling technology and is specially designed for the temperature management of battery modules. The system delivers coolant directly to each battery cell or battery pack to dissipate heat more efficiently, ensuring that all batteries operate within the optimal temperature range, thereby improving the performance, safety and life of the entire energy storage system. The structure of the string-type energy storage system is that the Pack batteries are connected in series to form a battery cluster. A single battery cluster (i.e., a battery in an energy storage cabinet) is connected to an energy storage inverter (integrated in the energy storage cabinet) to convert it into AC power. Multiple energy storage cabinets are connected in parallel and connected to the transformer for step-up and access to the grid after AC convergence. This decentralized architecture gives string-type energy storage a high degree of flexibility and scalability.

The global String Type Liquid-cooled Energy Storage System market size was estimated at USD 630.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
