Report Overview:

String-wound sediment filters are a variation of melt-blown filters. They are comprised of tightly wound cotton, polyester, or polypropylene string. This string is wrapped firmly around a core, creating a graded density that will trap particulate matter. As water travels through the layers of string, finer and finer particulate matter is removed. However, once string-wound filters become overloaded with sediment, the strings can begin to loosen and shift. This can allow debris back into the water and is an indication it is time for a filter replacement.

The Global String-wound Sediment Filter Market Size was estimated at USD 251.55 million in 2023 and is projected to reach USD 383.90 million by 2029, exhibiting a CAGR of 7.30% during the forecast period.
