Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Strontium Salt New Materials competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of Strontium Salt New Materials will reach 666,160 tons, with an average selling price of US\$1,542.8 per ton. In 2024, the global strontium salt production reached 666,160 tons, with an average selling price of US\$1,542.8 per ton. Strontium (Sr) is a silvery white alkaline earth metal that exists in nature mainly in the form of celestite (SrSO_4) and strontianite (SrCO_3). Strontium salt new materials refer to new materials with special properties obtained by modifying or compounding strontium salts. For example, strontium carbonate, strontium chloride, strontium nitrate, etc. have attracted much attention due to their unique role in material modification. These materials have broad application prospects in the fields of electronics, chemical industry, metallurgy, medicine, etc., and are even known as "industrial MSG". Demand in traditional sectors remains stable, while emerging sectors are experiencing explosive growth. Electronic ceramics: As a core raw material for MLCCs (multilayer ceramic capacitors), strontium titanate substrates reduce insertion loss in 5G filters by 18% and optimize temperature drift coefficients to below 5ppm/ $^{\circ}\text{C}$. This is driving the global electronic-grade strontium salt market to reach US\$105 million in 2023, with 85% destined for electronic ceramics. New energy materials: Strontium hydroxide-based electrode materials exhibit high specific capacity and cycle stability in batteries, potentially boosting battery energy density. In supercapacitors, their power density and cycle life offer significant advantages, meeting the needs of clean energy storage. Biomedical: Strontium sulfate preparations increase bone density in osteoporosis patients by an average of 1.8%-2.5% annually. Strontium-89 isotope complexes enable targeted bone cancer treatment, achieving an 82% pain relief rate,

driving demand for pharmaceutical-grade strontium salts. Import Dependence and Resource Bottlenecks Shortage of High-Value-Added Products: Domestic strontium salts are primarily low- and mid-range products. High-purity strontium salts (such as 6N grade) are over 70% imported, and their prices are 2-4 times higher than those of standard products. In 2023, China's strontium salt imports from Mexico and Germany accounted for 76.3% and 21.3%, respectively. Resource Security Pressure: Domestic strontium ore is primarily low- and mid-grade, with high-grade ore (grade >60%) imports accounting for over 60%. Imports reached a record high in 2021, leaving the resource self-sufficiency rate below 40%.

The global Strontium Salt New Materials market size was estimated at USD 1028.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
