Report Overview

Structured blue light 3D scanners are advanced imaging devices that utilize a structured light pattern projected onto an object to capture its three-dimensional surface geometry. The blue light spectrum is employed for its precision and accuracy in capturing fine details. These scanners typically employ a structured light source, such as a blue LED projector, to cast a known pattern onto the object. A camera captures the deformation of the pattern on the object's surface, and sophisticated software processes the data to generate a high-resolution 3D model. Structured blue light 3D scanners are widely used in various industries, including manufacturing, reverse engineering, quality control, and cultural heritage preservation, offering fast and precise non-contact measurement capabilities for objects of different shapes and sizes.
