Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Stud Type Track Roller competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The Stud Type Track Roller is an engineered motion unit integrating rolling contact mechanics with load-bearing structural design, specifically developed to withstand high loads and guiding constraints under combined operating conditions. Its core architecture comprises an outer ring raceway, rolling elements (cylindrical or crowned rollers), an integrated stud-type journal, and a sealing protection system. By converting sliding friction into low-damping rolling friction through conformal contact between the rolling elements and the mating track surface, the bearing achieves high-precision guidance and heavy-load transmission along predefined trajectories. The stud-integrated mounting configuration, achieved via rigid threaded connection directly embedded into the host structure, combines the load-carrying efficiency of rolling bearings with the positional rigidity of bolted fasteners, effectively eliminating assembly clearances and geometric errors associated with traditional split-mounting designs. Key design features include: a hardened and super-finished outer ring raceway surface with high hardness and low roughness, rolling elements employing logarithmic profile optimization for stress distribution, and a multi-barrier sealing system (combining lip seals and non-contact labyrinths) to resist contaminant ingress. The stud journal offers adaptable interfaces (full-thread, half-thread, or plain shaft) to accommodate diverse workpiece constraints. Applications span heavy-duty sliding tables in automated production lines, logistics conveyor rollers, industrial robot joints, engineering vehicle suspension systems, and actuator mechanisms in aerospace equipment, providing standardized motion component solutions for high-rigidity guidance, energy-efficient transmission, and long-life cycle operations while supporting the development of service life prediction models.

based on contact mechanics and fatigue theory.
