Abstracts

Styte, also known as hordeolum, is a painful and acute infection on the upper or lower eyelid. Majority of the cases of hordeolum are due to *Staphylococcus aureus* followed by *Staphylococcus epidermidis*. All age groups can be affected, although there is a slight increase in prevalence of styte in patients aged between 30 years and 50 years. Styte can be treated with topical ointment or sometimes oral antibiotics. However, in some cases, surgeries are performed. Typically, the size of the swelling is a direct indicator of the severity of the infection. Recurrent of hordeolum is usually due to failure to eliminate the bacteria completely.
