Abstracts

Sub Bottom Profilers (SBP) are specialized marine geophysical instruments that use high-frequency acoustic pulses to investigate and characterize the layers of sediment and rock beneath the seafloor. By emitting sound waves and analyzing their reflections, SBPs provide detailed, high-resolution sub-seabed imaging, revealing geological structures, sediment thickness, buried objects, and potential geohazards. These systems are essential tools for a wide range of underwater applications, including offshore site investigations for infrastructure development (e.g., wind farms, pipelines, cables), dredging operations, archaeological surveys, mineral exploration, and scientific research on sedimentary processes. Unlike side-scan sonars, which image the seafloor surface, or seismic reflection systems, which penetrate much deeper but with lower resolution, SBPs strike a balance by offering fine-scale stratigraphic detail within the upper tens to hundreds of meters below the seabed, making them indispensable for precise shallow subsurface mapping in marine environments.

The global Sub Bottom Profilers (Sbp) market size was estimated at USD 45.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
