Report Overview:

Sub-Step Direct-Acting Solenoid Valve is a combination of direct action and pilot type. When there is no pressure difference between the inlet and the outlet, after the power is turned on, the electromagnetic force directly lifts the pilot small valve and the main valve closing piece up in turn, and the valve opens. When the inlet and outlet reach the starting pressure difference, after the power is turned on, the electromagnetic force pilots the small valve, the pressure in the lower chamber of the main valve rises, and the pressure in the upper chamber drops, so as to use the pressure difference to push the main valve upwards; when the power is off, the pilot valve uses a spring The force or medium pressure pushes the closing member, moving downward, causing the valve to close.

The Global Sub-Step Direct-Acting Solenoid Valve Market Size was estimated at USD 1694.39 million in 2023 and is projected to reach USD 2444.62 million by 2029, exhibiting a CAGR of 6.30% during the forecast period.
