Report Overview:

Unlike the conventional Implantable Defibrillators which are implanted intravascular, the Subcutaneous Implantable Defibrillators are inserted subcutaneously under the skin, and uses a subcutaneous electrode placed near the heart, rather than into the heart as in case of conventional Implantable Defibrillators. A Subcutaneous Implantable Defibrillator consists of a small titanium case which contains battery, a subcutaneous electrode, and accessories such as insertion tool etc. If there is any abnormality in the patient's heartbeat, the subcutaneous implantable defibrillator sends an electrical impulse to restore normalcy in the heart rhythm, followed by pacing therapy in form of post shock bradycardia, if needed. Implantable defibrillators are useful in saving patients' lives with known history of ventricular tachycardia and arrhythmias.

The Global Subcutaneous Implantable Cardioverter Defibrillator Market Size was estimated at USD 577.20 million in 2023 and is projected to reach USD 895.78 million by 2029, exhibiting a CAGR of 7.60% during the forecast period.
