Abstracts

Subdural drainage catheters are specialized medical devices designed for the therapeutic evacuation of pathological fluid collections, such as blood or cerebrospinal fluid, from the subdural space—the potential area between the dura mater and the arachnoid membrane of the brain. These catheters are typically thin, flexible tubes made from biocompatible materials like silicone or polyurethane, and they are inserted via a burr hole or craniotomy to facilitate controlled drainage, reduce intracranial pressure, and prevent reaccumulation of fluid. They often feature radiopaque markers for imaging guidance and may include multiple drainage holes or specialized tips to optimize fluid removal while minimizing tissue trauma or blockage. Their use is indicated in conditions like chronic subdural hematomas, hygromas, or post-surgical drainage management, and they are integral to both emergency and elective neurosurgical procedures, requiring precise placement and monitoring to avoid complications such as infection or parenchymal injury.

The global Subdural Drainage Catheters market size was estimated at USD 270.55 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
