Abstracts

Sublingual immunotherapy (SLIT) is a form of allergen-specific immunotherapy administered via drops or tablets placed under the tongue, where the allergen extracts are absorbed through the oral mucosa to gradually desensitize the immune system to specific allergens such as pollen, dust mites, or pet dander. Unlike subcutaneous immunotherapy, which requires injections in a clinical setting, SLIT offers a non-invasive, convenient, and self-administrable option for patients, making it an increasingly preferred choice for long-term management of allergic conditions like allergic rhinitis and asthma. The treatment works by modulating the immune response, reducing symptoms, and potentially offering sustained remission even after discontinuation, positioning it as both a therapeutic and preventive approach in allergy care.

The global Sublingual Immunotherapy market size was estimated at USD 2650.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.80% during the forecast period.
