Abstracts

Submarine cable recycling refers to the process of recovering decommissioned, damaged, or unused submarine communications or power cables from the seabed. This operation is typically performed by specialized cable vessels equipped with underwater robots (ROVs), grappling hooks, or cutting equipment. Through precise positioning, severing, lifting, and reeling, the discarded cables are retrieved from the seabed sediment and brought back to the vessel. Recycling aims to prevent the long-term impact of old cables on the marine environment, avoid obstructions to fisheries and navigation, extract valuable metal materials (such as copper, aluminum, and steel) for reuse, and create safe passages for the laying of new cables. It is a key practice that integrates marine engineering with the circular economy.

The global Submarine Cable Recycling market size was estimated at USD 226.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
