Report Overview

Submarine-launched missiles are classified into two categories, as ballistic missiles (SLBMs) and cruise missiles (SLCMs). While the SLBMs are launched vertically, SLCMs are launched in a low-altitude trajectory. The submarines equipped with these missiles enhance the undersea operations and are capable of countering enemy attacks across the water. The changing nature of warfare has prompted countries to focus on fortifying security measures while developing advanced versions of military hardware and weaponry. An imperative need has emerged for the defense authorities to engage in stricter combat capabilities, and have stronger control over the surrounding or neighboring seas. As a result, there has been an emphasis on the need for submarine-launched missiles, which are increasingly being added to the inventories of the navies, globally.

One trend in the market is 3D printed submarine-launched missiles. 3D printing is an evolving technology, which can be used to create and design a number of things. By using 3D printing technology, conventional methods like computerized numerical control (CNC) cutting, mold manufacturing, or canvas printing can be bypassed. This technology can be used to print electronics directly onto 3D surfaces, such as on rocket engines, missile fins, and their guidance systems. It also reduces the size and weight of submarine-launched missile systems.
