## Abstracts

The submarine optical network system is a system designed for efficient information transmission. It can rapidly transfer large volumes of data, voice, images and other information between different locations at an extremely high speed, meeting the demand for rapid interaction of large - capacity information. This system features high stability, capable of operating stably for a long time in complex marine environments, resisting various adverse factors such as seawater corrosion and water pressure to ensure the continuity of information transmission. Its technical requirements are reflected in the laying and connection of optical cables. The optical cables need to be precisely laid at specified locations on the seabed, and all connection points must be firmly and reliably established to reduce signal transmission loss. Meanwhile, the system should have a powerful fault monitoring and repair ability, being able to promptly detect and handle faults such as optical cable damage and quickly restore the information transmission function.

The global Submarine Optical Network System market size was estimated at USD 2051.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
