Report Overview

Submerged Arc Welding (SAW) is a welding process that uses a continuously fed electrode and a blanket of granular flux to create a weld. The submerged-arc welding (SAW) process is similar to MIG where the arc is formed between a continuously-fed wire electrode and the workpiece, and the weld is formed by the arc melting the workpiece and the wire. However, in SAW a shielding gas is not required as the layer of flux generates the gases and slag to protect the weld pool and hot weld metal from contamination. Flux plays an additional role in adding alloying elements to the weld pool.

The global Submerged Arc Welding Materials market size was estimated at USD 1245.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
