Report Overview

Submersible Conductivity Probes are a type of sensors that are used to measure the electrical conductivity of water or other liquids. Submersible Conductivity Probes consist of a probe that is immersed in the liquid and a cable that connects the probe to a meter or a controller. The probe has two or more electrodes that generate an alternating current and measure the resistance of the liquid. The electrical conductivity of the liquid is proportional to the concentration of dissolved ions and salts in the liquid. Submersible Conductivity Probes are suitable for various applications, such as water quality monitoring, environmental testing, industrial process control, and others.
