Abstracts

A submersible load cell is a weighing sensor specifically designed for underwater environments. It is capable of measuring the force or weight applied by an object underwater and converting it into an electrical signal for output. Its basic principle is based on strain gauge technology or other force-to-electricity conversion principles. When subjected to an external force, the elastic element inside the sensor undergoes deformation, causing a change in the resistance of the strain gauge. This resistance change is then converted into a voltage signal, thereby enabling the measurement of weight or force. Such sensors typically possess special properties such as waterproofing and pressure resistance to adapt to the complex underwater working conditions.

The global Submersible Load Cells market size was estimated at USD 66.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
