## Abstracts

Submersible turbidity sensor is a device designed to be immersed in a liquid, typically water, to measure the degree of turbidity within it. Turbidity refers to the cloudiness or haziness of a liquid caused by the presence of suspended particles, such as clay, silt, algae, or other microscopic matter. This sensor works by emitting a light beam into the water and measuring the amount of light scattered back by these suspended particles. The greater the amount of scattered light, the higher the turbidity level, indicating a higher concentration of particles in the water.

The global Submersible Turbidity Sensor market size was estimated at USD 849.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
