Abstracts

A submount is used in electronics that provides mechanical support, electrical connections, and thermal management for electronic components such as LEDs, laser diodes, and photodiodes. Submounts are typically made from materials with high thermal conductivity and low coefficient of thermal expansion to help dissipate heat generated during operation and minimize the risk of warping or cracking. Common materials used for submounts include ceramics, metal, and diamond. In addition to providing thermal management, submounts also provide electrical connectivity between the electronic component and external circuitry. They often contain wires, pads, or other features to facilitate electrical connections, and their design can be optimized to minimize electrical resistance and improve performance. Overall, submounts play a critical role in the performance and reliability of electronic components by providing mechanical support, electrical connections, and thermal management. Global key players of Submount (Heatspreader) include Kyocera, MARUWA, Vishay, ALMT Corp, Murata, etc. The top five players hold a share about 58%. Asia-Pacific is the largest market, and has a share about 32%, followed by North America and Europe with share 30% and 26%, separately. In terms of product type, Ceramic Submount is the largest segment, occupied for a share of 54%. In terms of application, High Power LD/PD has a share about 74 percent.
