Report Overview

Subplate Mounted Heavy Duty Valve is a small amount of fluid flow from the Pressure A and B ports to the return port through the clearance between the rotor and the body. This interflow occurs whenever the valve is shifted from one position to another or when the valve is being used for throttling. This is due to the Shear-Seal in the valve being only partially covered by the rotor. Interflow is not leakage and does not occur when the valve is fully engaged.

The global Subplate Mounted Heavy Duty Valve market size was estimated at USD 420.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
