### Report Overview

A subscriber identity module or subscriber identification module (SIM), widely known as a SIM card, is an integrated circuit that is intended to securely store the international mobile subscriber identity (IMSI) number and its related key, which are used to identify and authenticate subscribers on mobile telephony devices (such as mobile phones and computers). It is also possible to store contact information on many SIM cards. SIM cards are always used on GSM phones; for CDMA phones, they are only needed for newer LTE-capable handsets. SIM cards can also be used in satellite phones, smart watches, computers, or cameras.

The increase in the development of triple SIM FF as one of the primary growth factors for this market. The triple SIM provides a solution for handling different SIM sizes and easing SIM management as it is innovated to combined all FFs in one single card with precise cuts. Additionally, it has also been noted that these triple SIMs can withstand temperature ranging from -40°C to +85°C.
