Report Overview

BOP is a high pressure mechanical safety valve system at the top of a well head, which prevents uncontrolled fluid flow in the well bore. This device is essential in the oil and gas industry as it monitors and controls pressure while drilling and is the last line of defense to prevent any subsea leakages or surface explosions. A BOP stack consists of two types of BOPs, annular BOP and ram BOP. An annular BOP is placed at the very top of the stack and then two, three, or four ram BOPs are placed below the annular BOP. BOP stack contains the wellbore fluids either in the annular space amid casing and tubing or in an exposed hole during drilling, completion, and testing operations. Rising subsea drilling activities and the necessity for effective oil and gas production propel the demand for blowout preventers systems. Growing demand for hydrocarbons accelerates the drilling activities, which in turn leads to the increasing demand for blowout preventers and drilling equipment. In order to optimize the extra expenditures and costs, efficient production of oil and gas is utmost important at the onshore and offshore fields. Growing number of safety regulations and attention towards the efficiency of the end-products play a vital role in the growth of the blowout preventers. The aforementioned reasons are expected to boost the demand for blowout preventers and thus in turn pushing the growth of the global blowout preventers market.
