## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Substrate Heaters competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global substrate heater production reached approximately 223 k units, with an average global market price of around US\$ 370 per unit. Substrate heater is a kind of equipment that precisely controls the temperature of substrates (such as semiconductor wafers, ceramics, glass, etc.) through electrothermal conversion. Its core function is to ensure that the substrate maintains a uniform and stable temperature field in a specific process.

**Market Concentration and Key Players:** Internationally, the market concentration degree of substrate heater is relatively low, mainly concentrated in Europe, America and other developed countries. For example, large manufacturers such as Neocera and MeiVac; from the domestic point of view, there is still a lot of room for development of substrate heaters.

**Manufacturing Processes and Market Trends:** The manufacturing process of the substrate heater focuses on thick film printing, lightweight structure and ultra-high temperature sintering. The thick film technology overlays insulating medium, resistance layer and conductor layer by layer on the substrate through screen printing, and forms an efficient heating circuit through high-temperature sintering. Su Yan Electronics breaks through the patent barrier to realize mass production of rare earth thick film heaters. Its thermal efficiency is 8% higher than that of traditional PTC and is suitable for the battery hydrothermal system of new energy vehicles. Sanhua Intelligent Control adopts the process of "welding fins first and then covering films." A lightweight fin structure having through holes is welded to a substrate to reduce the weight of the heater and to enhance the overall strength. The market trend highlights the dual-engine drive of new energy-led and high-end manufacturing expansion. The thermal management demand of new energy vehicles promotes the rapid increase of

penetration rate of thick film heaters. Meanwhile, the demand for ultra-high temperature vacuum heaters in semiconductor manufacturing increases sharply with the expansion of domestic chip production capacity. Intelligent and green manufacturing become the key to iteration. The system integrating IoT real-time monitoring and AI power regulation greatly optimizes energy consumption. The accelerated application of new materials such as graphene and aluminum nitride further reduces energy consumption for photothermal imaging, Low altitude aircraft and other emerging areas to provide technical support.

The global Substrate Heaters market size was estimated at USD 82.65 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.50% during the forecast period.
