Abstracts

Substrate-like PCB is abbreviated as SLP, which belongs to the category of PCB. Compared with HDI, the line width/line spacing of SLP can be shortened to 20/35 microns at the minimum. However, in terms of process, it cannot reach the specifications of IC substrate, and it is between HDI and IC substrate. From the perspective of downstream applications, the current mainstream of SLP-like substrates is used in consumer electronics, such as smart phones. In terms of substrate-like manufacturing, since the mainstream line width/line spacing is 20-30 microns (Zhen Ding Technology's 25-micron SLP has been mass-produced), SLP is mainly manufactured using MSAP process technology. Compared with HDI, under the same conditions, the number of electronic components carried can reach twice that of HDI. In terms of market competition, the leading companies of SLP-like substrates are mainly Zhen Ding Technology, Kinsus, Meiko, TTM Technologies, etc. The share of the world's top 5 companies exceeds 65%, and the core companies are mainly distributed in Taiwan, Japan, South Korea and the United States. With its high-density wiring, multi-layer stacking structure and excellent advanced packaging compatibility, SLP technology has successfully met the needs of increasingly miniaturized and high-performance electronic products. With the continuous advancement of technology, SLP technology is moving towards higher density and finer lines. However, compared with IC substrates, there is still a certain gap in the fineness of substrate-like substrates, which to a certain extent limits its price competitiveness in high-end applications such as mobile phones, thereby affecting the improvement of profit levels.

The global Substrate-like PCB (SLP) market size was estimated at USD 2854.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
