Abstracts

Sugar evaporator antiscalant is a chemical additive specifically designed for use in the sugar evaporation process to prevent and reduce the formation of scale within the evaporator. During sugar evaporation, due to high temperatures and concentration effects, minerals, colloids, and other insoluble components in the sugar syrup can easily deposit on the evaporator walls, forming difficult-to-remove scale layers. This not only reduces evaporation efficiency and increases energy consumption but May also affect the quality of sugar. The antiscalant, with its special chemical composition, can disperse, chelate, or neutralize these deposited substances, thereby preventing the formation of scale. It can also form a protective film on existing scale layers, slowing down the thickening rate. Using sugar evaporator antiscalant can significantly improve evaporator operating efficiency, extend equipment lifespan, and maintain the purity and quality of sugar products.

The global Sugar Evaporator Antiscalant market size was estimated at USD 843.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
