Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Super Invar competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global sales of Super-Invar alloys reached 1,965 tons, with an average selling price of US\$42,855 per ton. Super-Invar alloys are low-expansion alloys developed from traditional Invar (Fe-36Ni) by replacing some nickel with cobalt. A typical composition is Fe-32Ni-5Co (called Super-Invar 32-5). Its average linear expansion coefficient near room temperature can be as low as $0.5 \times 10^{-6} / ^\circ\text{C}$, lower than Invar, while still maintaining high strength and good low-temperature structural stability. Super Invar alloy (4J32/Alloy 32) is made from iron-based raw materials, containing 31.5-33% nickel, 3.2-4.2% cobalt, 0.4-0.8% copper, and trace amounts of C, Mn, and Si. Nickel and cobalt together account for approximately 35% of the alloy's weight. Their high prices, fluctuating with LME prices, directly determine that raw material costs account for over 55% of the total cost. Adding to this the need for vacuum induction melting (VIM) + electroslag remelting (ESR) to ensure purity, homogenization annealing, and multiple cold rolling, slitting, and oxide layer finishing processes, processing and testing costs account for approximately 35%. Ultimately, the market price of cold-rolled strip is approximately 240-350 RMB/kg, linked to monthly nickel and cobalt prices.

The global Super Invar market size was estimated at USD 84.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.70% during the forecast period.
