Abstracts

Supercapacitor diaphragms, also known as separators, are critical components in supercapacitors (electrochemical capacitors) that serve as insulating barriers between the electrodes while allowing ionic transport through their porous structure. These diaphragms prevent electrical short circuits while enabling the movement of ions between the anode and cathode, directly influencing key performance metrics such as energy density, power density, cycle life, and safety. Typically made from materials like cellulose, polypropylene, glass fiber, or advanced polymers, they are engineered for high porosity, mechanical strength, thermal stability, and electrolyte wettability. The effectiveness of a diaphragm is measured by its ability to minimize internal resistance and maximize ion permeability, making it a fundamental enabler of supercapacitor efficiency and reliability in applications ranging from consumer electronics to renewable energy storage and electric vehicles.

The global Supercapacitor Diaphragm market size was estimated at USD 128.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.75% during the forecast period.
