Abstracts

Superconducting substrates are specialized materials that serve as the foundational layer for the fabrication of superconducting devices, providing structural support, thermal management, and epitaxial growth surfaces for thin-film superconductors such as YBCO (yttrium barium copper oxide) or iron-based compounds; these substrates must exhibit specific properties including lattice matching to minimize defects, high thermal conductivity to dissipate heat, chemical inertness to prevent interfacial reactions, and mechanical stability to withstand processing conditions, with common materials including single-crystal oxides like sapphire (Al₂O₃), lanthanum aluminate (LaAlO₃), and strontium titanate (SrTiO₃), as well as metallic substrates such as Hastelloy with buffer layers, enabling applications in quantum computing, medical imaging (MRI magnets), particle accelerators, and advanced power transmission systems.

The global Superconducting Substrate market size was estimated at USD 380.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
