Report Overview

Supercontinuum generation is a process where laser light is converted to light with a very broad spectral bandwidth (i.e., low temporal coherence), i.e., a super-wide continuous optical spectrum. This means that the temporal coherence is very low (but with important restrictions – see below!), whereas the spatial coherence usually remains high. In many cases, optical fibers are used for supercontinuum generation. Frequently, one uses photonic crystal fibers, which can be made with tailored chromatic dispersion properties and often also exhibit increased nonlinearity due to strong mode confinement. Some special solutions, which are less widely used, are briefly mentioned in the following:
