Abstracts

Supercontinuum light sources are advanced optoelectronic devices that generate broadband, coherent light by exploiting nonlinear optical effects to spectrally broaden intense laser pulses, typically from a narrowband pump laser, into a continuous spectrum that can span from the ultraviolet to the mid-infrared range. These sources are characterized by their high brightness, spatial coherence, and smooth spectral output, making them valuable in applications requiring a single, versatile light source to replace multiple lasers or lamps. Key technologies involved include photonic crystal fibers, highly nonlinear fibers, and specialized pump lasers, with performance metrics such as spectral bandwidth, power stability, and beam quality being critical for differentiation. The versatility of supercontinuum light sources enables their use across diverse fields, including optical coherence tomography, spectroscopy, microscopy, metrology, and biomedical imaging, where their ability to provide a wide wavelength range from a compact setup offers significant advantages over traditional light sources.

The global Supercontinuum Light Source market size was estimated at USD 215.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
