## Abstracts

Supercritical extraction services are customized technology solutions that utilize supercritical fluids (such as CO<sub>2</sub>) at temperatures and pressures above their critical point to efficiently and selectively extract target components by manipulating their solubility parameters and diffusion coefficients. This service leverages the combined properties of supercritical fluids, which combine high gas diffusivity and strong liquid solubility. Incorporating process modules such as dynamic extraction, multi-stage separation, and countercurrent extraction, it can precisely adapt to diverse scenarios, including the food industry (e.g., deodorization of natural spices), the pharmaceutical field (e.g., purification of heat-sensitive bioactive ingredients), and environmental management (e.g., separation of organic pollutants from industrial wastewater). It provides comprehensive technical support, from laboratory pilot-scale process development and pilot-scale scale-up verification to industrial production. With core advantages such as environmental friendliness (no solvent residue), low operating temperatures (to avoid degradation of heat-sensitive ingredients), and high separation efficiency, it has become a key technology for the extraction and purification of high-value-added substances.

The global Supercritical Extraction Services market size was estimated at USD 989.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
