Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Supercritical Foams competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Supercritical foams are polymeric or composite foam materials produced using supercritical fluids?most commonly supercritical carbon dioxide (scCO₂) or supercritical nitrogen?as physical blowing agents during the foaming process. A fluid becomes supercritical when it is at a temperature and pressure above its critical point, allowing it to exhibit both gas-like and liquid-like properties. In this state, the fluid can diffuse easily into polymers and form fine, uniform gas cells upon rapid depressurization, creating lightweight foams with highly controlled microstructures. Supercritical foaming is often favored for its environmentally friendly nature, as it avoids traditional chemical blowing agents and enables precision control of cell size, density, and mechanical properties. These foams are widely used in applications that demand thermal insulation, impact absorption, lightweight structural materials, and biomedical scaffolds.

The global Supercritical Foams market size was estimated at USD 1283.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
