Report Overview

Supercritical steam generator is a type of boiler used in power plants to produce high-pressure, high-temperature steam for electricity generation. It operates at supercritical pressure and temperature conditions, which means that the water and steam inside the boiler exist as a single-phase fluid with properties that do not follow the usual liquid-vapor phase boundaries. Supercritical steam generators are commonly used in modern fossil fuel power plants, including coal-fired and natural gas-fired power plants. These boilers offer higher efficiency, lower emissions, and greater flexibility in power plant operations, contributing to more sustainable and efficient electricity generation.
