Abstracts

Superelastic shape memory alloys (SMAs) are a unique class of metal alloys that exhibit exceptional elasticity and the ability to return to their original shape after significant deformation. This remarkable property, known as superelasticity or pseudoelasticity, occurs due to a reversible phase transformation between the austenite and martensite phases at specific temperature ranges. Unlike conventional metals that experience plastic deformation when stressed beyond their elastic limit, superelastic SMAs can recover large strains—often up to 8%—without permanent deformation. Commonly made from nickel-titanium (NiTi) and other alloy compositions, these materials are widely used in medical devices such as stents and orthodontic wires, as well as in aerospace, robotics, and seismic damping applications. Their high flexibility, fatigue resistance, and self-healing characteristics make them ideal for industries requiring durable and adaptive materials.

The global Superelastic Shape Memory Alloys market size was estimated at USD 1073.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.40% during the forecast period.
