Report Overview:

Superluminescent light-emitting diode (SLED) has developed rapidly in recent years. It is a semiconductor optoelectronic device between laser (LD) and light-emitting diode (LED). The luminescence mechanism is a directional radiation phenomenon under strong excitation. That is, when the excitation density is high enough, the spontaneously emitted photons are amplified by excitation and avalanche-like multiplication, the luminous intensity increases sharply with the excitation intensity, the width of the spectral line narrows, and the initial spontaneous emission dominates the rapid evolution. Not dominated by stimulated emission. The ideal superradiant light is an incoherent light source with inconsistent phase or short-coherent light source.

The Global Superluminescent Light Emitting Diodes (SLEDs) Market Size was estimated at USD 113.35 million in 2023 and is projected to reach USD 154.52 million by 2029, exhibiting a CAGR of 5.30% during the forecast period.
