Report Overview

Superparamagnetic Iron Oxide Nanoparticles (SPION) are a type of nanomaterial composed of iron oxide particles that exhibit superparamagnetic properties. These nanoparticles are typically in the range of 1 to 100 nanometers in size. When exposed to an external magnetic field, SPIONs become magnetized, but they do not retain any magnetization once the field is removed, which is characteristic of superparamagnetism. This property makes them highly useful in various biomedical applications, including magnetic resonance imaging (MRI) as contrast agents, targeted drug delivery systems, and hyperthermia treatment for cancer. SPIONs can be engineered to have specific surface coatings to improve their biocompatibility and functionalization, allowing for precise targeting of specific cells or tissues. Their unique magnetic properties, combined with their ability to be modified for various functions, make SPIONs a valuable tool in both medical diagnostics and therapeutic applications.
