Abstracts

Superparamagnetic particles (SPPs) are nanoscale or microscale magnetic materials, typically composed of iron oxide or other ferrites, that exhibit unique magnetic properties: they become strongly magnetized in the presence of an external magnetic field but lose their magnetization once the field is removed, preventing aggregation and enabling precise control in applications. These particles are often functionalized with coatings or ligands to enhance biocompatibility, stability, and target specificity, making them indispensable in biomedical fields such as magnetic resonance imaging (MRI) contrast enhancement, targeted drug delivery, hyperthermia cancer treatment, and magnetic separation techniques like immunomagnetic cell sorting and diagnostic assays. Beyond healthcare, SPPs are utilized in environmental remediation for pollutant extraction, in industrial processes as catalysts or in ferrofluids, and in electronics for data storage and sensors. Their versatility stems from the combination of magnetic responsiveness, tunable surface chemistry, and scalability, positioning them as critical components in both existing commercial products and emerging advanced technologies.

The global Superparamagnetic Particles market size was estimated at USD 820.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
