Abstracts

A supersonic combustion ramjet, commonly known as a scramjet, is an advanced air-breathing propulsion system designed to operate efficiently at hypersonic speeds, typically above Mach 5, where traditional jet engines become impractical. Unlike conventional engines, scramjets lack rotating compressor and turbine components; instead, they rely on the high-speed forward motion of the vehicle to compress incoming air, which then mixes with fuel and combusts at supersonic velocities within the engine. This design enables extremely high-speed flight with greater fuel efficiency compared to rocket engines for sustained atmospheric travel, making it ideal for applications such as hypersonic missiles, reconnaissance aircraft, space launch systems, and future high-speed transport. The technology represents a critical advancement in aeronautical and aerospace engineering, bridging the gap between atmospheric flight and space access.

The global Supersonic Combustion Ramjet market size was estimated at USD 85.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
