## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Support Unit for Low Shaft Centers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global average unit price of support unit for low shaft centers is about US\$36-52 per set, and the annual production is estimated to be about 42 million sets. This type of support unit is a type of mechanical support component designed for working conditions with compact axis arrangement and limited installation space. It is mainly used to provide stable shaft end positioning and axial preload support in ball screws, linear modules and precision transmission mechanisms. Compared with standard support units, low shaft center models usually have a lower installation height and a more compact appearance structure, which is convenient for installation in equipment with low planes or strict center of gravity requirements, such as semiconductor equipment, electronic assembly machinery, medical instruments and desktop CNC systems. Its internal structure mostly uses high-precision angular contact bearings or thrust ball bearings to ensure high rigidity and low clearance support performance in a small volume, while supporting bidirectional loads or high speed operation. Some products have pre-assembled structures, taking into account both rapid assembly and self-aligning functions.

The global Support Unit for Low Shaft Centers market size was estimated at USD 124.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
