Abstracts

Supraglottic airway devices (SADs) are medical devices used to establish and maintain a patent airway during anesthesia, emergency medicine, and critical care settings, designed to be inserted blindly or with minimal visualization into the pharynx to sit above the glottis, thereby allowing ventilation without the need for tracheal intubation; they typically consist of an inflatable cuff that seals around the laryngeal inlet and a tube for gas delivery, with common variants including the laryngeal mask airway (LMA), i-gel, and laryngeal tube, offering advantages such as ease of use, rapid insertion, and reduced risk of airway trauma compared to endotracheal tubes, though they are generally unsuitable for long-term ventilation or in patients with high aspiration risk. The global market for these devices is driven by rising surgical volumes, increasing prevalence of respiratory conditions, growing adoption in pre-hospital and emergency care, and technological advancements leading to second-generation devices with gastric access channels and improved seal pressures, while market growth is tempered by competition from endotracheal tubes and videolaryngoscopy, stringent regulatory requirements, and the risk of complications such as sore throat or nerve injury; geographically, North America and Europe dominate due to well-established healthcare infrastructure and high procedural rates, though Asia-Pacific is emerging as a high-growth region fueled by expanding medical tourism, healthcare investments, and rising awareness of advanced airway management techniques.

The global Supraglottic Airway Devices market size was estimated at USD 642.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.65% during the forecast period.
