Abstracts

Supramalleolar orthoses (SMOs) are specialized lower limb orthotic devices designed to provide support, stabilization, and alignment for the foot and ankle while allowing controlled mobility; they extend just above the malleoli (ankle bones) and are commonly used to address biomechanical impairments such as excessive pronation, supination, weak ankle stability, or mild to moderate deformities in pediatric or adult populations with conditions like cerebral palsy, stroke, or neuromuscular disorders. These devices typically consist of custom-molded or prefabricated thermoplastic shells, often paired with straps or closures, and are engineered to influence joint positioning and gait patterns without restricting knee or full ankle motion, making them distinct from more rigid ankle-foot orthoses (AFOs) in both design and functional application.

The global Supramalleolar Orthoses market size was estimated at USD 185.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
