Abstracts

Surface combustion systems are advanced industrial heating solutions that utilize radiant heat transfer from a porous ceramic or metallic surface, where fuel and air are premixed and combusted within the matrix rather than in an open flame, resulting in uniform temperature distribution, high thermal efficiency, and significantly reduced nitrogen oxide (NOx) emissions compared to conventional burners. These systems are primarily employed in heat treatment processes such as annealing, tempering, and sintering across metals, ceramics, and glass manufacturing, offering precise control over atmosphere and temperature while enabling rapid heating and cooling cycles essential for specialized industrial applications requiring consistent product quality and energy savings.

The global Surface Combustion Systems market size was estimated at USD 385.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
