Abstracts

Surface grinding services refer to precision machining services that use a grinding wheel to remove a small amount of material from the surface of a workpiece, so as to obtain a smooth and flat surface. The grinding wheel is usually made of abrasive particles such as aluminum oxide, silicon carbide, etc., which are bonded by a bonding agent and mounted on the spindle to rotate at high speed. The workpiece is fixed on a magnetic chuck or a clamping fixture, and the grinding wheel moves relative to the workpiece, and the abrasive particles on the grinding wheel remove material from the surface of the workpiece through cutting, plowing, rubbing and other actions. Surface grinding is applicable to a variety of materials, including normalized and hardened steel, stainless steel and other metals, as well as some plastics, ceramics, composites, etc. However, for softer materials, attention should be paid to preventing them from blocking the pores of the grinding wheel. Widely used in aerospace, automotive, mold and die making, medical equipment and other industries. For example, in the aerospace industry, it is used to ensure the tight tolerances of components such as turbine blades; in the automotive industry, it is used for the precise fitting of cylinder heads and transmission parts; in the medical equipment industry, it is used to process surgical instruments to obtain accurate dimensions and polished surfaces.

The global Surface Grinding Services market size was estimated at USD 7254.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
