Abstracts

In surface mount capacitive touch sensors, the insulator is coated with a conductive coating on one side of its surface, and the current is applied to all corners of the conductive coating. When an external conductor like a human finger comes into contact with a surface, capacitance forms between them and draws more current from the corner. The currents are measured at each corner and their ratio will determine where the touch is placed on the surface for durability, solidity and an attractive appearance.

The global Surface Mount Capacitive Touch Sensor market size was estimated at USD 1050.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.65% during the forecast period.
