Abstracts

A Surface Mount Double Layer Capacitor is a capacitor that uses an electrochemical reaction to store charge. They are commonly used as backup power supplies and energy storage, and can provide high capacitance and high current output capabilities when a large amount of output power is required for a short period of time. Surface mount electric double layer capacitors are different from ordinary electrolytic capacitors in that the electrodes are made of activated carbon material with high surface area. This material has an extremely high specific surface area, allowing the capacitor to store more charge and have a higher energy density. Electric double layer capacitors also employ an ionic conductor, such as an electrolyte or polymer electrolyte, to separate the positive and negative electrodes and transfer charge. Surface mount electric double layer capacitors are widely used in various fields such as consumer electronics, smart grid, automobiles, medical equipment, robotics, and aviation due to their advantages such as high energy density, long life, fast charge and discharge, and good temperature characteristics Aerospace, etc.

The global Surface Mount Electric Double Layer Capacitors market size was estimated at USD 1250.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
