Abstracts

Surface mount thermistors are miniaturized, two-terminal semiconductor devices that exhibit a predictable and significant change in electrical resistance with temperature variations, designed for direct mounting onto printed circuit boards (PCBs) using surface mount technology (SMT). These passive components function as temperature sensors or temperature compensation elements in electronic circuits, with negative temperature coefficient (NTC) types commonly used for precise temperature measurement and positive temperature coefficient (PTC) variants often employed for overcurrent protection or self-regulating heating applications. Key characteristics include their compact form factor, high sensitivity, fast response times due to low thermal mass, and compatibility with automated assembly processes, making them integral in modern electronics where space constraints, reliability, and efficient manufacturing are critical.

The global Surface Mount Thermistors market size was estimated at USD 118.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.75% during the forecast period.
