### Report Overview

The working principle of the surface oil recovery machine is to use the physical properties of different gravity and surface tension between oil and water, so that the oil scraping belt absorbs organic liquids such as floating oil and heavy oil when it passes through the water surface. When the oil-carrying belt bypasses the heavy wheel and leaves the liquid surface upwards, the oil on the liquid surface is adsorbed on the surface of the filter belt and enters the secondary separation tank, and then enters the collector after secondary separation.
