Abstracts

Passivation involves depositing protective materials on the surface of metals or metal alloys to enhance their resistance to environmental factors. The layered material can be organic or inorganic and should have excellent electrical insulation, strong substrate adhesion, and be able to block the intrusion of chemicals. For the enhancement of the chemical and mechanical properties of semiconductor and varistor surfaces, passivated glass powder is the material of choice, which acts as a hermetic enclosure for separating components. Glass is a strong choice for passivation materials due to its unique combination of properties. For example, glass can be formulated in a variety of ways, and common types include lead and zinc glass powder, all of which are free of alkali metals and alkaline earth metals, with a dense glass structure and good network connectivity. This enables manufacturers to produce glass that can meet low-voltage and high-voltage electrical specifications, match the thermal expansion coefficient of semiconductor materials, and meet low-temperature processing requirements. Among them, lead glass is widely used as a passivation glass, accounting for 61.96% in 2023. During the diode processing, molten glass is required to passivate the wafer to protect the P-N junction and extend the service life. From the application point of view, the proportion of diode use is much higher, accounting for more than 50% in 2023. There are not many players in the global surface passivated glass powder market, including Schott, Nippon Electric Glass, Vibrantz Technologies, Beijing Xunizi Electronic Glass, and Heraeus, etc. The market concentration is high, and the top three accounted for 89% in 2023. In the fast-paced field of semiconductor manufacturing, precision and reliability are crucial. With the development of 5G technology, the demand for power semiconductors in the communications industry has surged. Among many feasible materials, glass has good insulation properties, which can increase the breakdown voltage of semiconductor devices, reduce leakage current, and provide good protection for devices. With the increasing popularity of smart devices and advances in the

automotive and aerospace fields, the surface passivated glass powder market is expected to continue to grow in the coming years.

The global Surface Passivated Glass Powders market size was estimated at USD 96.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
