Abstracts

Surface roughness testers and profilometers are instruments used to measure the surface roughness of a material. Surface roughness testers typically use a stylus or a probe to scan the surface of the material and provide numerical values or a graphical representation of the roughness characteristics, such as average roughness (Ra), root mean square roughness (Rq), peak-to-valley height (Rt), and other parameters. Profilometers are more advanced instruments that can provide a detailed 3D profile of the surface roughness by measuring the vertical deviations of the surface. Profilometers can be contact or non-contact types, and they are commonly used in industries such as manufacturing, automotive, aerospace, and research to ensure the quality and consistency of surfaces.

The global Surface Roughness Testers And Profilometers market size was estimated at USD 785.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
